

Fetal Viability (Dating) Scan – 6-10 Weeks

About the Fetal Viability (Dating) Scan:

This is an ultrasound examination that is usually carried out using a transvaginal (internal) probe. It aims to determine the number of fetuses present and whether the pregnancy is progressing normally inside the uterus (womb).

Why do we Perform a Fetal Viability Scan:

The early scan is helpful in the following circumstances:

- To assess pain or bleeding in early pregnancy
- To date the pregnancy accurately
- To provide reassurance to women with previous miscarriage or ectopic pregnancy

Results of the Scan:

All results will be given to you immediately at the time of your visit. In the event of an abnormal result, we will contact your gynaecologist or GP. Alternatively, we can refer you to a gynaecologist for further advice if you prefer.
